

Delivering Unsurpassed Security & Productivity

An evolving payments terrain is placing new demands on organizations for compliance and accountability during check processing. The **SecureCheck-PRO** MICR check printing system is designed to meet today's requirements by improving the functionality and security of an organization's check disbursement process.

SecureCheck-PRO not only enhances your processing security and controls with workflow, event notifications, audit trails, event logs, and more. It additionally increases the security of printed checks by adding features to help protect and defeat the latest check fraud schemes.

SecureCheck continues to set the industry standards, recently introducing additional security features that help protect against check fraud:

- **Security Watermark**
- **Comprehensive Email Notifications** *Optional*
- **Workflow / Check-Approval Processing** *Optional*
- **Check Image Archiving** *Optional*
- **Enhanced Audit Capabilities**

The system also offers superior functionality that adds time-and-cost savings for multi-user, multi-workstation check processing environments, with features like:

- **Blank Check Stock Usage**
Eliminates requirements to purchase and store pre-printed checks, for cost savings of up to 70%
- **Automatic Check-Account Overlay Selection**
Eliminate possible human error and also enable mixed-account check runs.
- **Automatic Printer and Tray Selection**
- **Flexible Check Design Capabilities**
Print checks for just one or hundreds of bank accounts; update your check layouts any time quickly and easily.
- **Check / Form Sorting and Duplexing Capabilities**
- **Complete End-to-End Check Printing Automation**

SecureCheck-PRO offers compatibility with virtually every operating system and accounting application, and now, with a software-only option, with any PCL5e-enabled printer as well. The system is powered by the Secure Print Control Center (Secure PCC) that houses SecureCheck-Pro's state-of-the-art PowerForm™ capabilities. PowerForm Technology delivers a superior level of check printing security, productivity, and automation.

Printer-Based Solution

Typically configured as a hardware-software solution, *SecureCheck-PRO* creates each check at the printer which provides optimal security and also enables the system to work with accounting applications based on Windows, UNIX, AS/400 and other platforms.

Integrated Check Printing

Windows users as well as UNIX and AS/400 users can each configure their check printing to take full advantage of all of the functionality and features packed into *SecureCheck-PRO*. For Windows users, to print checks is as easy as selecting the SC Driver from their file print selection. There is no need to exit the program to print checks. Direct printing users have the option of using Check Mode, ACL commands or Direct Printing via the Secure PCC to print checks.

Network Configuration

SecureCheck-PRO can be set up as a stand-alone or networked solution. If networked, SecureCheck can be accessed by multiple users locally and remotely for check processing and printing.

Secure Software Print *New!* Option

Print to any PCL5e printer on your network with software-only check printing. No printer hardware required! This is an ideal solution to have available for disaster recovery.

Fully-Automated Check Printing *New!*

No other check printing system compares to the level of secure automation that *SecureCheck-PRO* offers. When automation features are enabled, a user simply clicks print from their accounting application. The system intelligence then parses the data for security and automation purposes. *SecureCheck* can then automatically:

1. Send emails for check-run approval (Workflow option).
2. Select the correct check account (single or mixed-account check runs).
3. Select the correct printer/s and tray/s for checks and copies.
4. Sort checks as required.
5. Duplex checks, copies and audits as required.
6. Print copies or create pdf images of all printed checks (Secure-Image option).
7. Send email Notifications to specified recipients that check printing has occurred (Notifications option)

Configure *SecureCheck-PRO*'s flexible system to meet your organization's needs for automation, security, and fraud prevention compliance.

Integrated Positive Pay *Option*

SecurePay, the nation's leading client-side positive pay solution, automatically integrates with *SecureCheck-PRO* on the host server. It will automatically convert check-issue information into any bank's positive pay specifications, send appropriate email notifications for review and approval, and transmit the file to one or multiple banks. Positive Pay is considered an essential *Best Practice* for fraud prevention.

**End-to-End
Check Printing Automation
and Checks-and-Balances**

SecureCheck-PRO offers industry-leading functionality:

- automatic check-account selection
- automatic printer selection
- auditing
- workflow / approval processing
- sorting and duplexing
- image archiving
- email notifications

**PowerForm Technology Increases
Check Processing Accuracy and Efficiency**

- Eliminate human error and save time with automatic printer and check-account selection. Never again print checks with the wrong check-account information!
- Print mixed-account check runs.
- Print to multiple printers as needed for greater efficiency.

Features for Greater Efficiency & Savings

PowerForm Technology New!

PowerForm Technology is the secure digital envelope that encases your data each time you print checks. Three layers of intelligence are merged with your variable check data to synergistically create greater security and efficiency during the check creation process:

1.) Form-Graphic Overlay

Each form-graphic overlay is comprised of form text objects, graphic objects, and a command component that SecureCheck-Pro merges with the your accounting data to create a completed check.

Multiple Checking Accounts

The system allows you to set up form-graphic overlays for over 100 different checking accounts. The system administrator controls all checking account information, including checking account numbers and MICR lines, bank names and addresses, and company names and addresses. If you need to change any of this information or add a new account, simply enter the new data into the check set-up screen and save the information.

Logos, Signatures, and Other Objects

The form-graphic overlay offers 10 form text objects and 6 graphic objects per page, for greater flexibility in overlay creation. These objects are in addition to those that comprise the static form overlay. Logos, signatures and other objects are stored inside the printer to be automatically and securely placed on your checks. When you need to change a check graphic or text object, simply import and attach a new object to that graphic overlay.

Advanced Audit Capabilities

The graphic overlay also offers 11 auditable fields (payee, amount, check date, check number, account, zip, +5 additional audit fields of your choice), providing users with the most powerful audit capacity and security available.

2.) Data Parsing

PowerForm Technology parses your accounting data for security and automation purposes.

Audit Trail

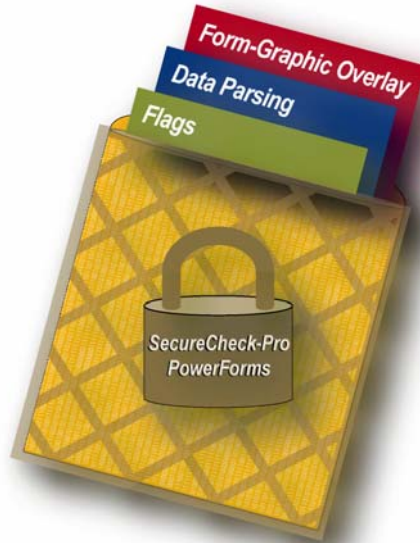

Users with permissions can access a PC-based and printer-based audit trail containing information on all printed checks. (See *security features*)

Signature Logic

Based upon check amount, apply printer-based intuitive logic for the control of digital signatures. *Signature Logic* places zero, one, two, or more signatures on a check depending on the check's amount. Manual signatures can be mandated for checks over a specified amount or individual users can be enabled with signatory control for specified dollar ranges.

Printed-Check Security Features

Accounting application data is used to add security features to the face of your printed checks: Security Watermark and Security Fonts. (See *security features*)

3.) Flags

Flags are a valuable way automate check processing tasks.

Automatic Check-Account Selection

From within the overlay setup, you have the option to flag an audit field for automated selection of the correct overlay and overflow overlay.

Automatic Printer Selection

From within the overlay setup, you have the option to specify automated selection of the correct check printer.

Mixed-Account Check Runs

With *Automatic Check-Account Selection*, the correct overlay will be automatically assigned to each check based on check data. This enables you to print mixed-account check runs. You also have the capability to print mixed-account check runs to multiple printers.

Sorting New!

The enhanced audit capabilities enable up to a three-level sort of checks before printing. The sort can be based on zip, check number, and/or payee name. This feature may be used with single- or multiple-account check runs.

Manual Checks

Manually print a single check or series of checks without accessing your accounting package. Quickly access previously entered names and addresses with a payee address book.

No More Pre-Printed Forms

SecureCheck-Pro can also create all your internal forms (W-2s, 1099s, transcripts, Pos, invoices, etc.) Save up to 70% on form production and also eliminate secure storage requirements for pre-printed forms.

Duplexing New!

Checks/forms and copies can be set to automatically duplex and pull from the appropriate tray. A user can also set their audit report to print duplexed. (for *duplex-enabled printers*)

Copies

Any number of copies of an original check can be printed. Users also have the ability to print copies using different forms, even multiple copies using different forms for each copy. With the Secure-Image option, users have the capability to create pdf images of each printed check and potentially eliminate copy requirements. (See *security features*)

Features for Optimal Security

Security Watermark **New!**

Print a security watermark across the face of your checks. The watermark contains the payee name and amount, and you customize the look with your specifications for line spacing, pitch, and grayscale.

Security Fonts

Print the check amount in **Reverse Font** or **Micro Font** at a second location on your checks, for greater security.

Event Notifications **New!**

Option

For increased security, send email notifications to specified recipients regarding check printing activity. These notifications can be set by graphic overlay, and include any of the following:

- Notice that check printing has occurred, from what account, and to which printer.
- Notice that check printing has occurred, along with one of two audits: Detailed or Summary
- Notice to select administrators of excessive failed login attempts.
- Notice for checks over specified dollar amounts.
- Notice to select administrators regarding additions/changes to overlays.

Workflow

Check-Approval Processing **New!**

Option

Adding the Workflow / Check-Approval Processing option divides check printing duties among employees to create a system of checks-and-balances. Whenever a check run is created, specified administrators are emailed an audit for review. After review, the administrators can opt to approve, deny, or place the job on hold for printing, and accompany this decision with notification to the user that created the check run.

SecureCheck-PRO: A Platform for the Future

Designed to meet check-processing requirements for both today and tomorrow, **SecureCheck-PRO** is the right platform for your check disbursement process.

Printer-Based Audit Trail

The *SecureCheck-PRO* Control Board is a secure encrypted repository of all sensitive check objects and check printing activity captured and stored at the printer. The audit trail contains the following information: Check Sequence, Check Date, Check Number, Payee, Amount, Date Printed, Account Number and System User. Compact flash has a standard audit trail size is 50,000 records.

Audit Retrieval **New!**

Copy the audit from any TCP/IP-connected printers and add it to the host audit (for sort, filter, and export).

Secure-Image™ **New!**

Check Imaging

Option

With Secure-Image, keep an exact replica of each printed check in .pdf format. Archive images of your checks as they are being printed. User can adjust the location, orientation, and content of the watermark that is placed on the images. Images are attached to the audit file for later review and re-printing as needed. Eliminate the need to print copies.

Security Permissions

Six levels of security permission can be assigned in any combination for each SecureCheck user. **Double-login** requirements are also assignable where a user must log in with another senior individual during system startup. Security permissions include: administrator, audit, overlay setup, manual check, print check, and overlay printing. Users can be limited to accessing only specified form-graphic overlays as well.

Remote Double-Login **New!**

Remote double-login is an optional setting that adds convenience to the double-login feature by allowing the second login to occur at a remote computer.

SecureCheck-PRO Specifications

PC

- Pentium III or higher processor is recommended
- Operating System: Windows 2000 • Windows XP/Pro • Windows Server 2000 & 2003
- 128 MB of RAM minimum
- SVGA color monitor with 800 * 600 resolution capability (1024 * 768 resolution is recommended)

Print Stream

- Generic Text - ASCII • PCL 5e

HP LaserJet Compatibility

Current Models:

4240, 4250, 4350, 9050

Previous Models:

2420, 2430, 4100, 4200, 4300, 9000

Note: Some older model HP printers also compatible but with loss of some of the newer SC-Pro functionality.

Printing Options

- Windows Print Driver • Direct Printing
- ACL Printing • Check Mode

Software-Only

Printer Compatibility

All PCL 5e compatible printers
Partial List: Lexmark, Canon, Xerox, Brother

About AP Technology

Established in 1989 as AcuPrint Inc., AP Technology was the original pioneer of secure MICR laser check printing systems, and today continues to lead the way in developing the most advanced check printing systems available. AP Technology now brings you the **SecureCheck-PRO Series**, a family of check printing solutions designed to meet the unique demands of any size business.

With over 6000 customers, no other vendor has more expertise in implementing and servicing secure financial data requirements on such a wide array of systems and accounting applications. AP Technology has been awarded several patents related to security and payment, and is founding member of Hewlett-Packard's Solutions Business Partner (SBP) group.
